

Baikal GVD experiment

Rastislav Dvornický
on behalf of the Baikal collaboration,
DLNP, JINR, Dubna, Russia & Comenius University, Bratislava, Slovakia

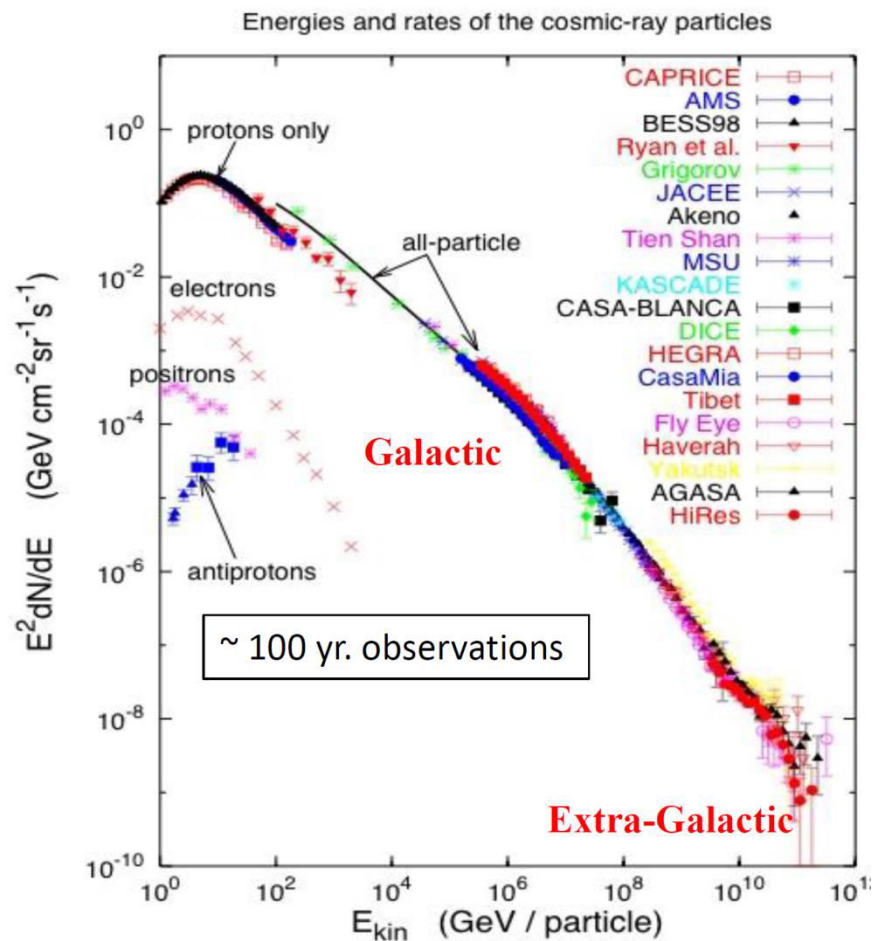

Collaboration: 9 institutions

- 1. Institute for Nuclear Research, Moscow, Russia.**
- 2. Joint Institute for Nuclear Research, Dubna, Russia.**
- 3. Irkutsk State University, Irkutsk, Russia.**
- 4. Skobeltsyn Institute of Nuclear Physics MSU, Moscow, Russia.**
- 5. Nizhny Novgorod State Technical University, Russia.**
- 6. St.Petersburg State Marine University, Russia.**
- 7. EvoLogics GmbH., Berlin, Germany.**
- 8. Institute of Experimental and Applied Physics, Czech Technical University, Prague, Czech Republic.**
- 9. Comenius University, Bratislava, Slovakia.**

Other associated institutions:

- Krakow University, Poland**
- University of Bucharest, Romania**

Cosmic rays:

Galactic sources: TeV – EeV ?

SNR, micro-quasars, pulsars

Extra-Galactic sources: EeV–PeV...

AGN, GRB,...

Energy spectrum and mass composition ☺

Sources location ?

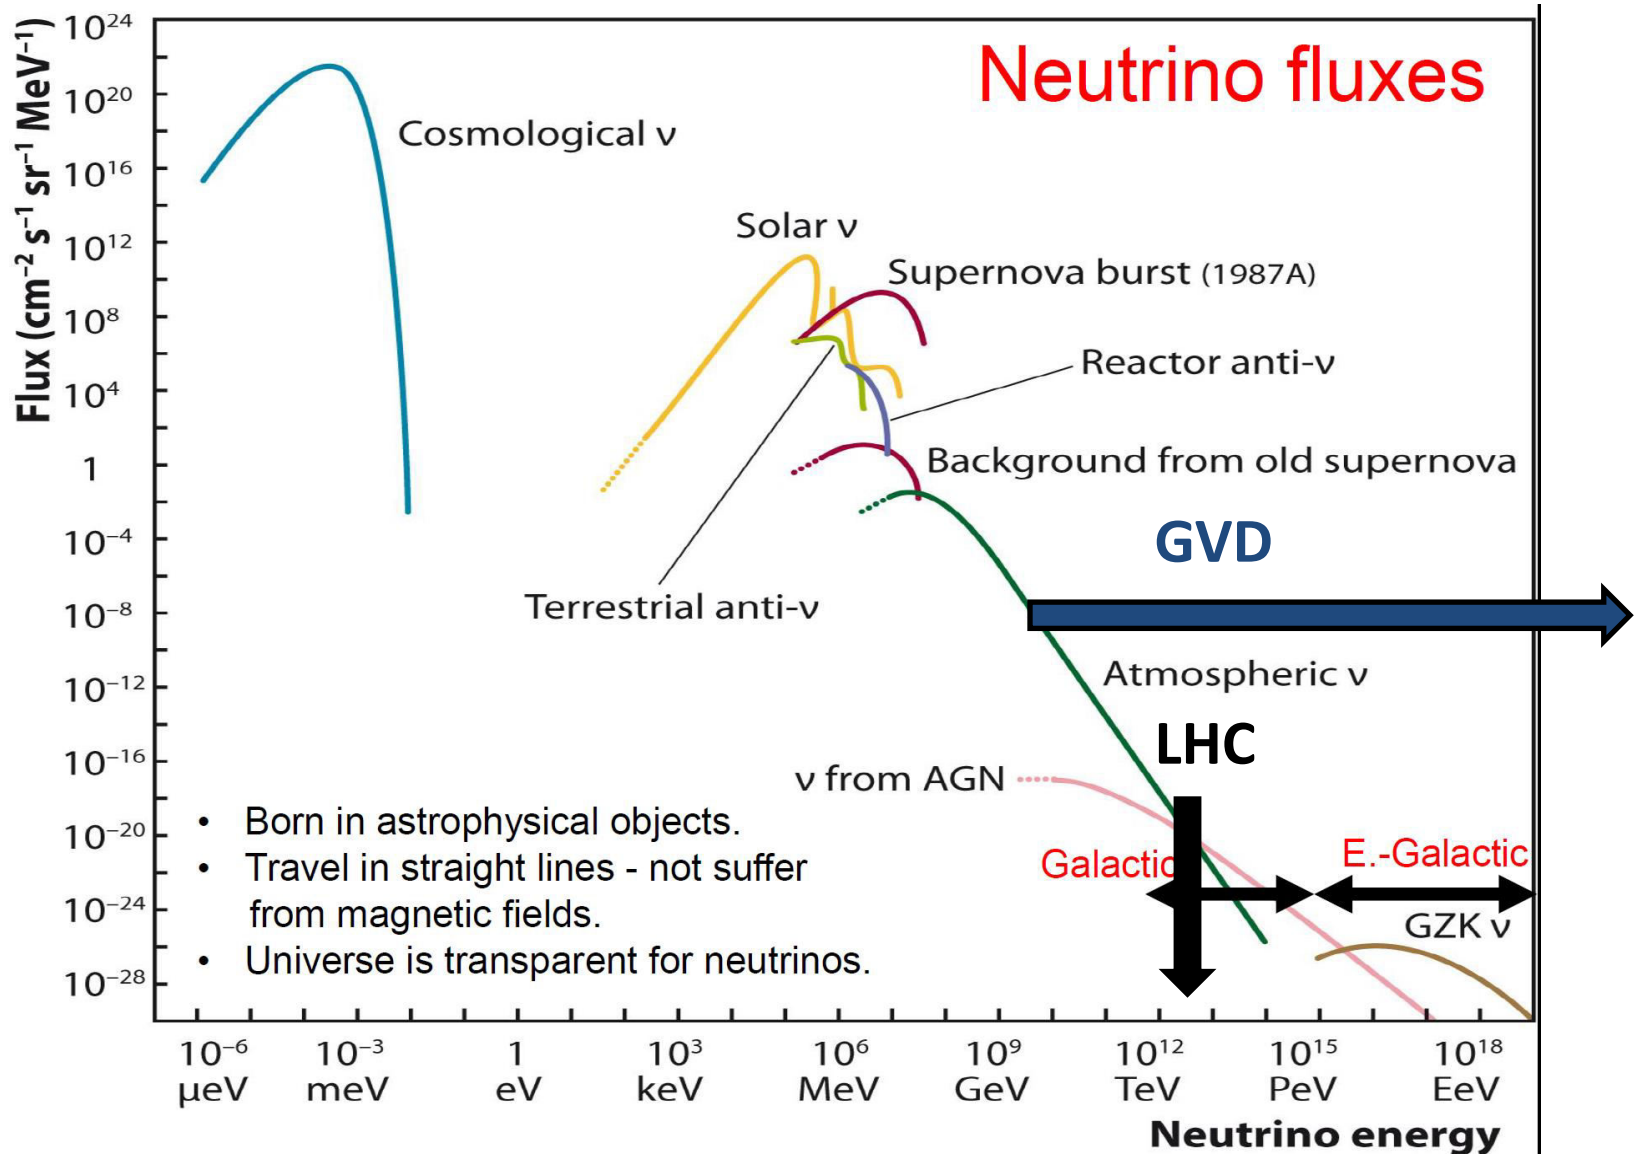

Charged cosmic rays vs. γ rays vs. neutrinos

Neutrinos – one of the 3 messengers

Neutrinos – one of the 3 messengers

M. Markov (1960): We propose to install detectors deep in a lake or in the sea and to determine the direction of charged particles with the help of Cherenkov radiation.

Detection Principle – M. Markov 1960

Flux

From local sources, diffuse flux

Detection

modes

muons, cascades

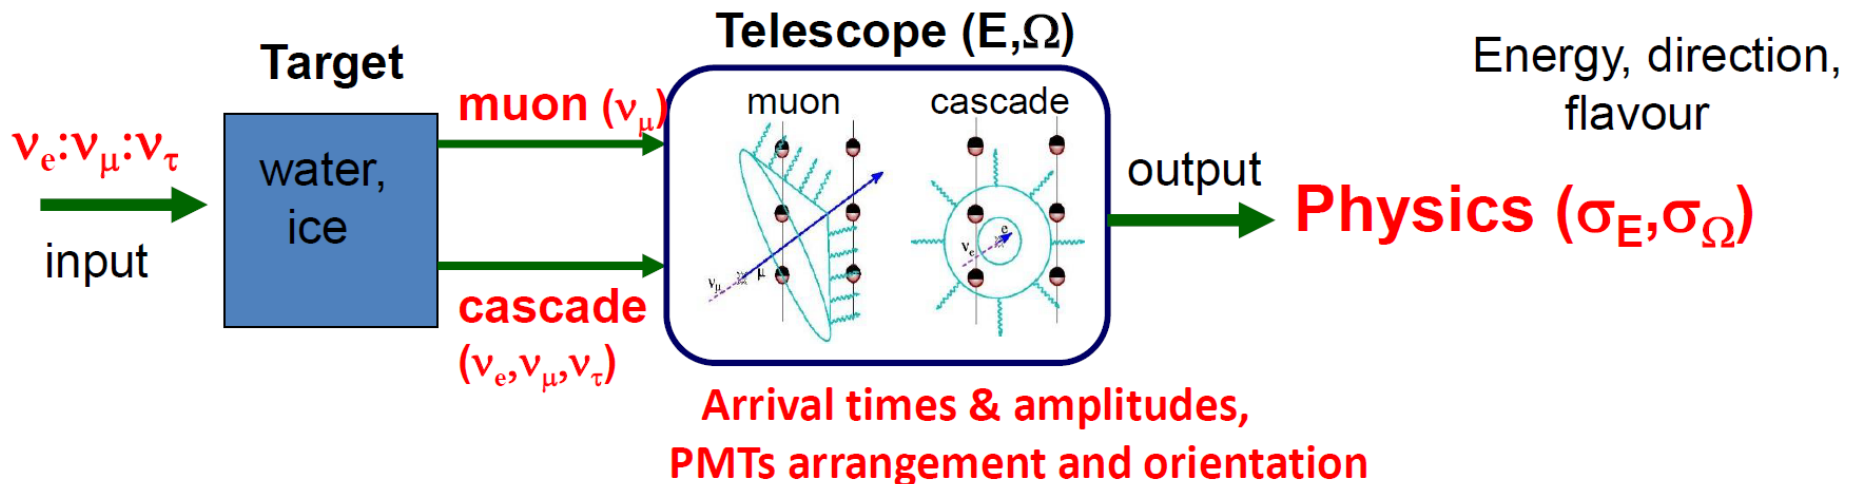

Environment

properties

absorption, scattering, light background – K^{40} , bioluminescence

Background

downward going atm. muons, atm. neutrinos

Cherenkov light

- Charged particle travelling faster than the speed of light in a particular environment radiates Cherenkov light

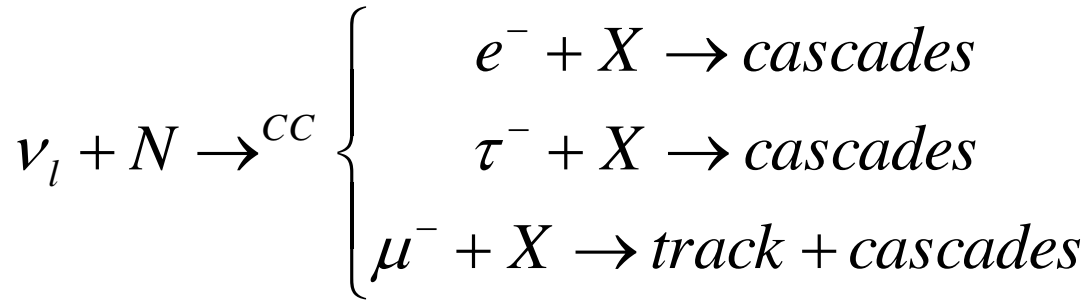

- Effect known for ultrasonic airplanes

- Pale blue light

Detection principle

• Cherenkov radiation is detected by an array of photo-sensors

• Optical Module

Downward going muon

Upward going neutrino

Background muon bundle

High-energy cascade

• Neutrino cross sections

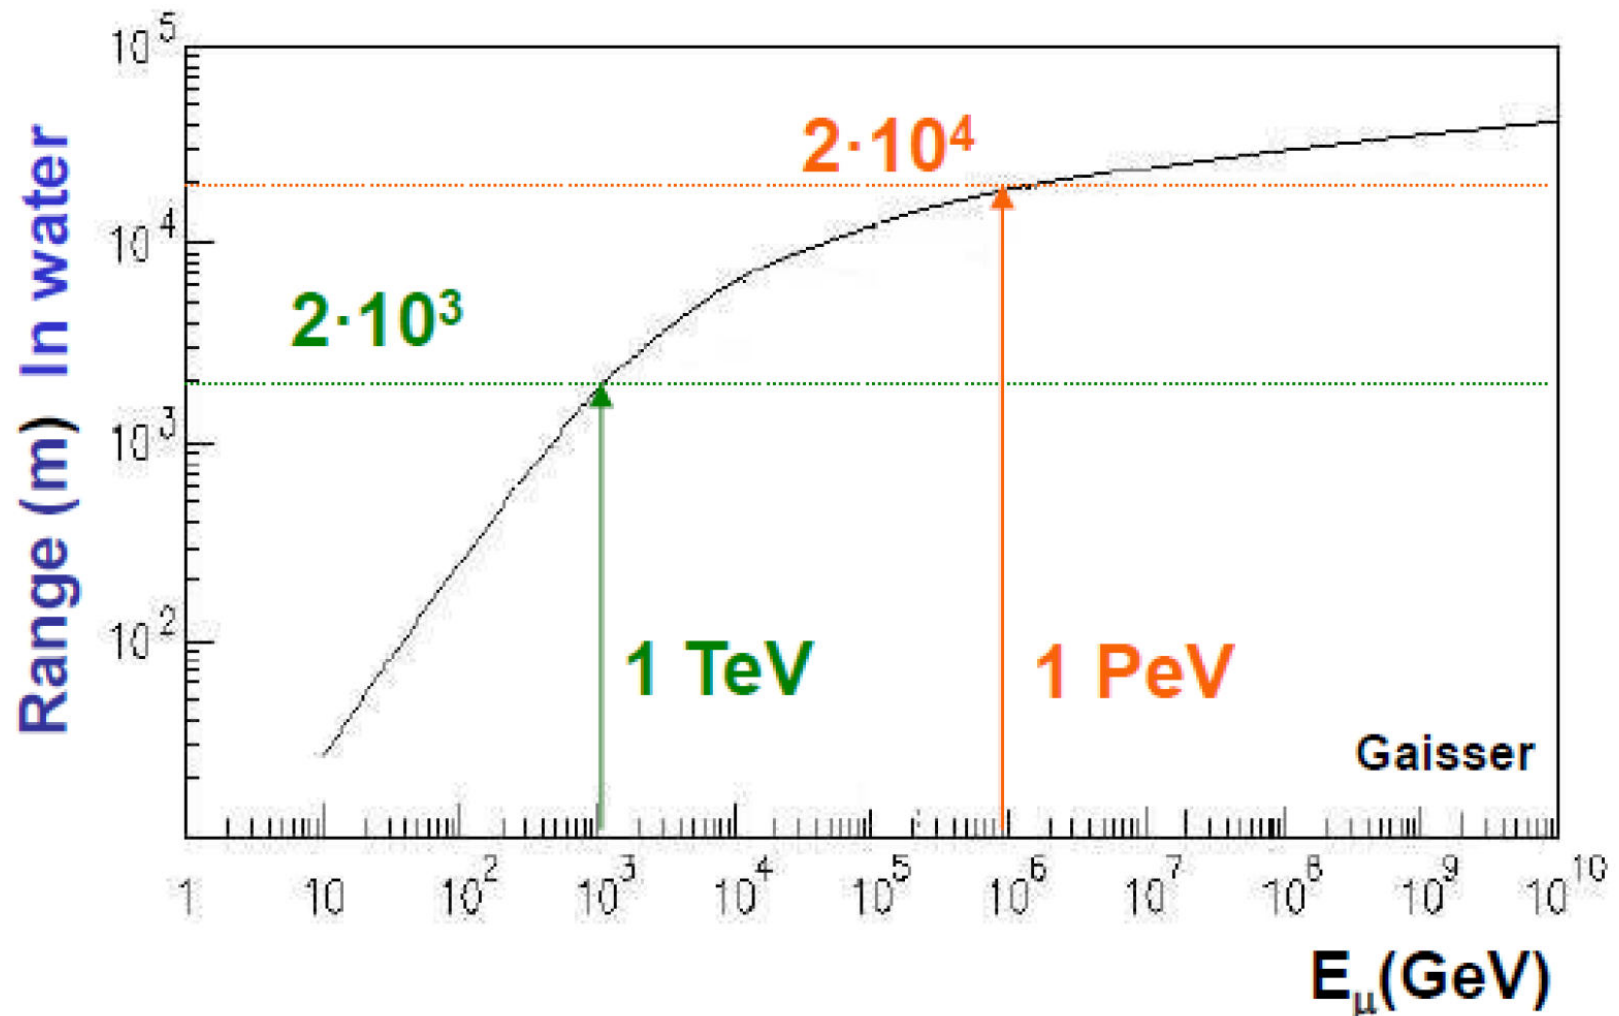

Earth transparency to HE neutrinos

"Glashow resonance"
 neutrino energy: $6.3 \cdot 10^{15}$ eV,
 resonance width: ± 130 TeV,
 peak cross section: $5 \cdot 10^{-31}$ cm²

Muon energy loss and range in water

• Muon Detection Mode

✓ Muons from ν_μ (CC):

$$N_{ch} = n_\mu (1 + 0.6E(TeV))$$

- High angular resolution $\sim 0.1^\circ - 1^\circ$
(depends on visible track length)
- Enlarged effective volume
(water/ice & bedrock for **up-going ν_μ**)
- Emits strongly in the Cherenkov angle

Baikal GVD - Gigaton Volume Detector

Objectives:

- km³-scale 3D-array of photo sensors
- flexible structure allowing an upgrade and/or a rearrangement of the main building blocks (clusters)
- high sensitivity and resolution of neutrino energy, direction and flavor content

Central Physics Goals:

- Investigate Galactic and Extragalactic neutrino “point sources” in energy range $E > \text{TeV}$
- Diffuse neutrino flux – energy spectrum, local and global anisotropy, flavor content
- Transient sources (GRB, ...)
- Dark matter – indirect search
- Exotic particles – monopoles, Q-balls, ...

Water properties

Count rates versus time for string No. 1

- **Absorption length: ~ 22-24 m**
- **Scattering length: $L_s \sim 30-50$ m**
 $L_{\text{eff}} = L_s / (1 - \langle \cos\theta \rangle) \sim 300-500$ m
- **Strongly anisotropic phase function:**
 $\langle \cos\theta \rangle \sim 0.9$

- **Moderately low background in fresh water:**

15 – 40 kHz (R7081HQE)
 absence of high luminosity bursts
 from biology and K^{40} background.

$E = 107 \text{ TeV}$, $\theta = 56.6^\circ$, $\rho = 68 \text{ m}$, $z = -59 \text{ m}$

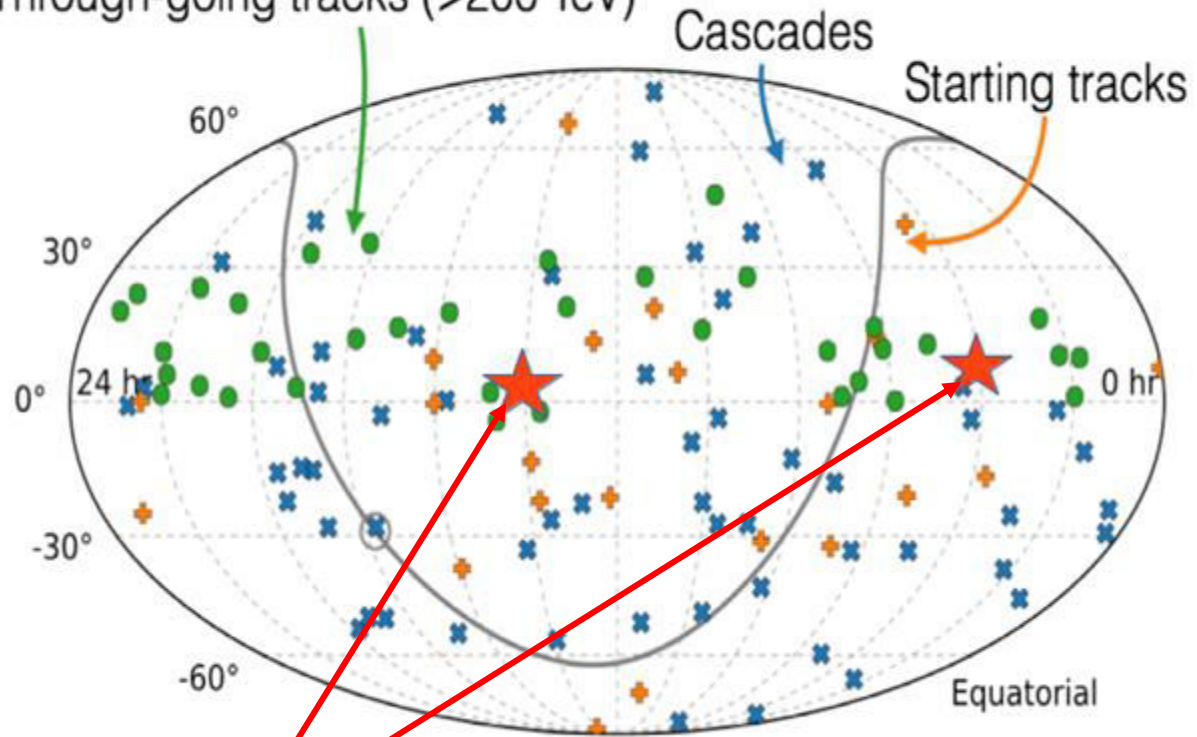

Cascade: $E=157$ TeV, $\theta = 57^\circ$, $\varphi = 249^\circ$
 $x=-25$ m, $y=-37$ m, $z=11$ m, $\rho=44$ m

Events from above event selections with energy cut.

Through-going tracks (>200 TeV)

GVD events

Site properties – 106 km КБЖД

120 m

15 m – DAQ center

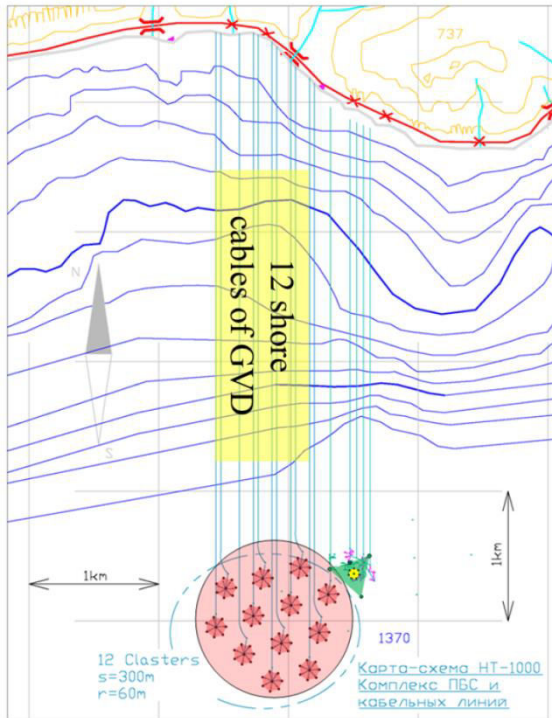

1 366 m – from surface to bottom

525 m - height

Location: $104^{\circ}25' E$, $51^{\circ}46' N$

Site properties – 106 km КБЖД

Depth – 1360 m; Flat the lake bed at >3 km from the shore – allows > 250 km³ Instrumented Water Volume!

Distance is shorter during the winter period

- **Infrastructure**

• Infrastructure

Lab

Living quarters

Shore station

Upgrade: control center in a new cabin

Winter expedition

Making ice holes

Dismantling the string

String attachment

Deployment of the string

Tea break to warm up a little bit

Cables to the shore station

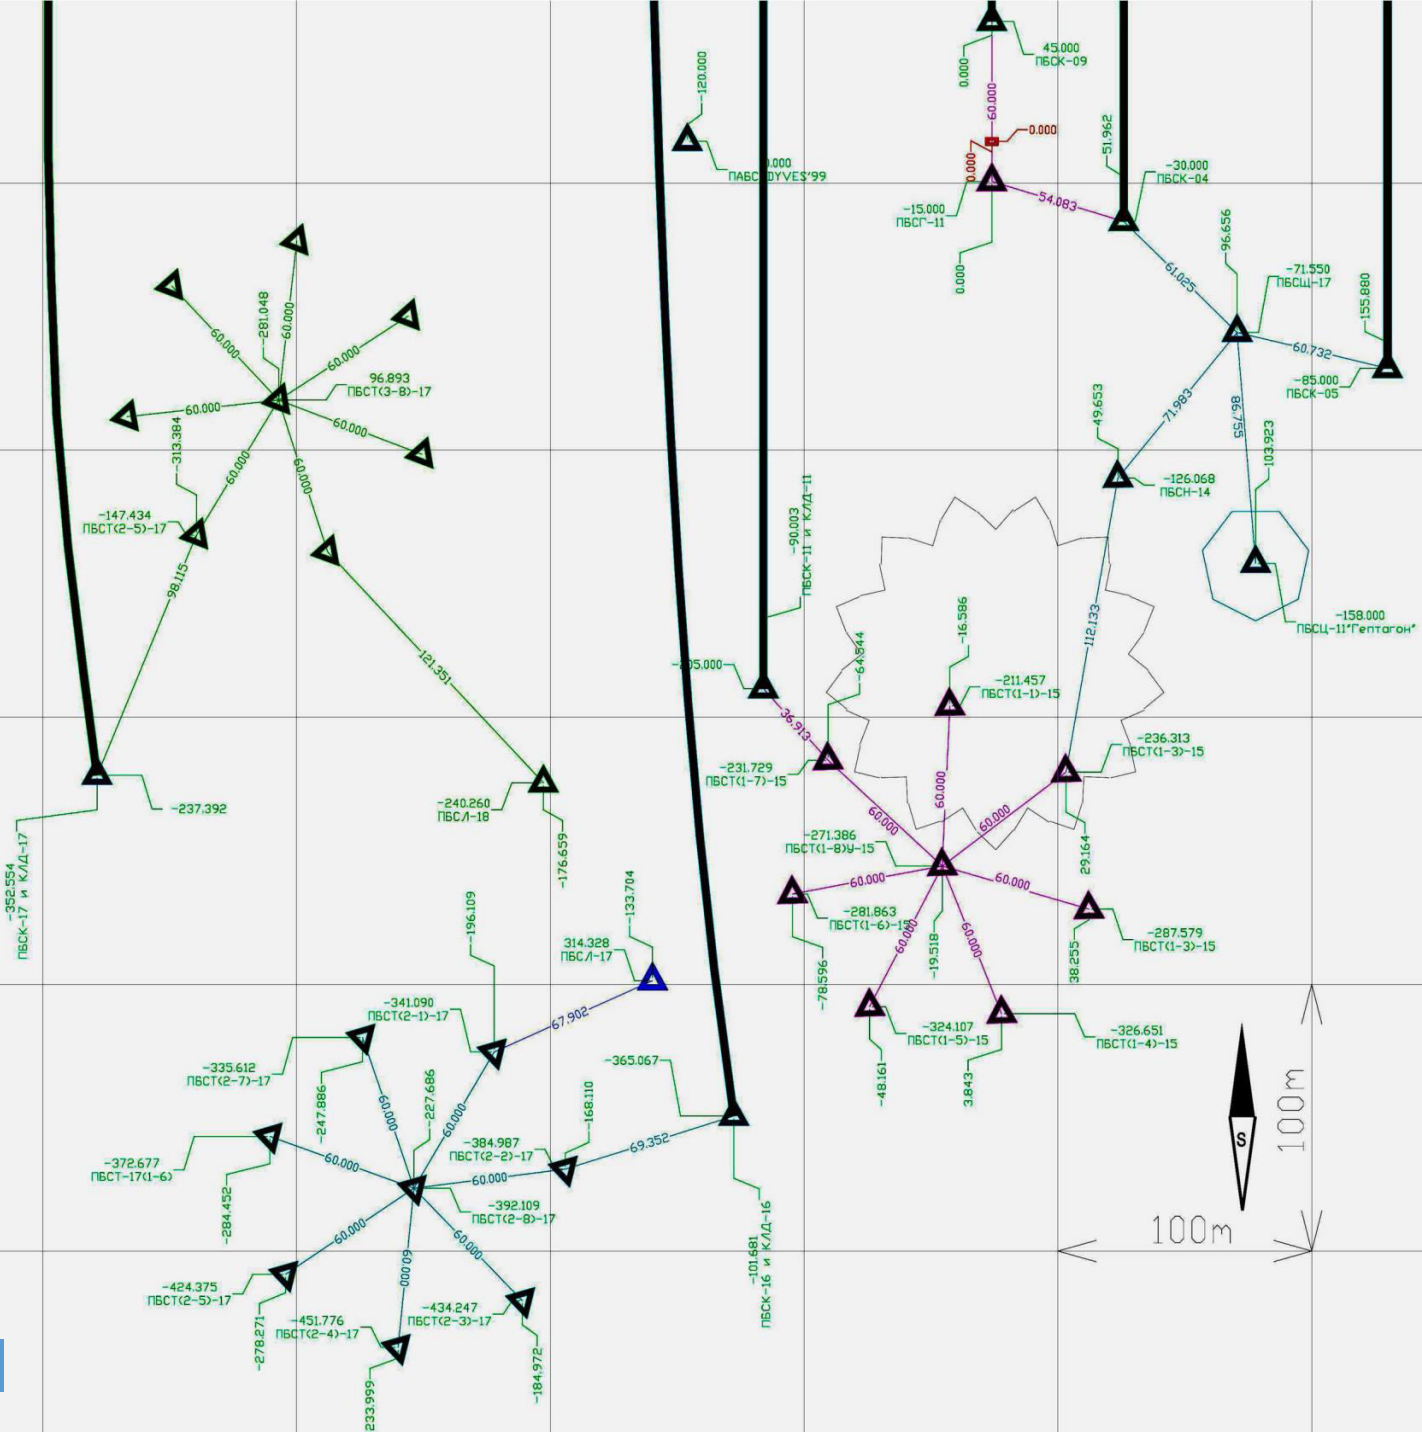

The end of the winter expedition

The end of the winter expedition

GVD-18

Old NT200:
volume $\sim 0.0001 \text{ km}^3$

Third cluster April 2018
All 3 clusters taking data

Now clearly
bypassed
ANTARES

No. PMTs:

ANTARES: 885

GVD 2018: 864

No. space points:

ANTARES: 295

GVD 2018: 864

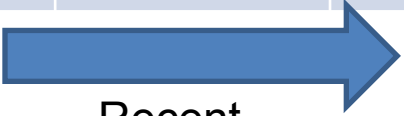

Stages of deployment of the Baikal-GVD

Configuration	2015	2016	2017	2018
The number of OMs	192 (8str×24)	288 (8str×36)	576	864
Geometric sizes	∅80m×345m	∅120m×525m	2×∅120m×525m	3×∅120m×525m
Eff. Vol. (E > 100TeV)	0.03 km ³	0.05 km ³	0.1 km ³	0.15 km ³

Timeline GVD 1

Cumulative number of clusters vs. year

Year	2016	2017	2018	2019	2020	2021
No. of clusters	<i>1</i>	<i>2</i>	<i>4</i>	<i>6</i>	<i>8</i>	<i>10</i>
No. of OM	<i>288</i>	<i>576</i>	<i>1152</i>	<i>1728</i>	<i>2304</i>	<i>2592</i>

 **3** **5** **7** **9**

Recent numbers

Deployment plan for expedition 2019

BAIKAL GVD-1

2304 light sensors
combined in 8
clusters of vertical
strings at 750 – 1300
m depths.
Detection volume
 0.4km^3

Baikal, Mediterranean Sea, South Pole

Thank You for your attention
